

2) what are the operations you can done with DDL so far?

↳ DDL plays with the structure of the table

↳ for eg:-

- adding (or) removing columns from a table

- Renaming table (or) columns in the table

- modifying data types of columns

- Adding (or) removing constraints like

 - ↳ foreign key
 - ↳ primary key

 - ↳ unique
 - ↳ default
 - ↳ not null
 - ↳ null

- Removing table (or) Database from the server

3) What are DML?

DML - (Data Manipulation Language)

manipulation - संशोधन

↳ with (DDL) you can play with structure of table

↳ whereas with (DML) you can play with actual

Data inside the table

4) What are DML Commands in SQL?

↳ **INSERT** (used to insert data into the table)

↳ **UPDATE** (used to update the existing data inside the table)

↳ **DELETE** (used to delete the existing data inside the table)

5) What are the ways you can insert data into table?

(i) you can insert single row

(ii) you can insert multiple rows at a time

(iii) you can insert data from another table into

new table, But note \Rightarrow the columns inside the newly created table should be similar to the table you're taking

data, Also the (column count) should also want to be same in both tables

(i) how to insert single row with values for All columns?

51. desc school;

| Field | Type | Null | Key | Default | Extra |
|----------|-------------|------|-----|---------|-------|
| stu_id | int | NO | PRI | | |
| stu_name | varchar(20) | YES | | | |
| stu_age | int | YES | | | |
| grade | varchar(10) | YES | | | |

you're going to insert values for these columns.

52 insert into school values(1,'lavanya',20,'A');
53. select * from school;

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | A |

The SQL command `INSERT INTO school VALUES (1, 'lavanya', 20, 'A');` adds a ^{row} new record to the `school` table. The values inserted are:

- 1 for the student ID
- 'lavanya' for the student name
- 20 for the age
- 'A' for the grade

This command assumes the `school` table has columns in this exact order.

→ how to insert single row with only values for specific columns?

```
55. insert into school(stu_id,stu_age) values(2,20);
```

```
56. select * from school;
```

| Result Grid | | | |
|--------------------|----------|---------|-------|
| Filter Rows | | | |
| Edit | | | |
| Export/Import | | | |
| Wrap Cell Contents | | | |
| stu_id | stu_name | stu_age | grade |
| 1 | lavanya | 20 | A |
| 2 | | 20 | |

The SQL command `INSERT INTO school(stu_id, stu_age) VALUES (2, 20);` adds a new record to the `school` table with:

- 2 for the `stu_id` (student ID)
- 20 for the `stu_age` (student age)

This command only specifies values for the `stu_id` and `stu_age` columns, leaving other columns in the `school` table (like `student name` or `grade`) to be filled with their default values or to be `NULL` if no default is provided.

(11) how to insert multiple rows with values for all columns at a time?

```
58. insert into school values (3, 'jaanu', 21, 'A'), (4, 'lakshit', 10, 'B'), (5, 'darshith', 7, 'B');
```

```
59. select * from school;
```

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | A |
| 2 | | 20 | |
| 3 | jaanu | 21 | A |
| 4 | lakshit | 10 | B |
| 5 | darshith | 7 | B |

The SQL command `INSERT INTO school VALUES (3, 'jaanu', 21, 'A'), (4, 'lakshit', 10, 'B'), (5, 'darshith', 7, 'B');` adds multiple records to the `school` table in a single operation.

The records being added are:

1. `(3, 'jaanu', 21, 'A')` — where 3 is the student ID, 'jaanu' is the name, 21 is the age, and 'A' is the grade.
2. `(4, 'lakshit', 10, 'B')` — where 4 is the student ID, 'lakshit' is the name, 10 is the age, and 'B' is the grade.
3. `(5, 'darshith', 7, 'B')` — where 5 is the student ID, 'darshith' is the name, 7 is the age, and 'B' is the grade.

Note ⇒

Each tuple corresponds to a new row in the `school` table. •

→ how to insert multiple rows values for specific columns?

61. `insert into school(stu_id,stu_age) values (6,41),(7,50),(8,70);`

62. `select * from school;`

| Result Grid | | | |
|---|----------|---------|-------|
| Filter Rows: | | | |
| Edit: Export/Import: Wrap Cell Content: | | | |
| stu_id | stu_name | stu_age | grade |
| 1 | lavanya | 20 | A |
| 2 | NULL | 20 | NULL |
| 3 | jaanu | 21 | A |
| 4 | lakshit | 10 | B |
| 5 | darshith | 7 | B |
| 6 | NULL | 41 | NULL |
| 7 | NULL | 50 | NULL |
| 8 | NULL | 70 | NULL |

The SQL command `INSERT INTO school(stu_id, stu_age) VALUES (6, 41), (7, 50), (8, 70);` adds three new records to the `school` table with:

- 6 for the `stu_id` and 41 for the `stu_age`
- 7 for the `stu_id` and 50 for the `stu_age`
- 8 for the `stu_id` and 70 for the `stu_age`

This command only specifies values for the `stu_id` and `stu_age` columns, leaving other columns (like `student name` or `grade`) to be filled with their default values or `NULL`, depending on the table's schema. if suppose those columns schema has default values it is filled with default values.

(III) how to insert values from another table into newly created table?

```
62. select * from school;
```

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | A |
| 2 | | 20 | |
| 3 | jaanu | 21 | A |
| 4 | lakshit | 10 | B |
| 5 | darshith | 7 | B |
| 6 | | 41 | |
| 7 | | 50 | |
| 8 | | 70 | |

Select only rows with 'A' grade from school table and insert those rows inside the a-grade table

Create table

```
64. CREATE TABLE a_grade (  
65     stu_id INT,    stu_name VARCHAR(20),  
66     stu_age INT,   grade VARCHAR(10)  
67 );
```

insert values

```
68. insert into a_grade  
69     select * from school where grade='A';
```

```
71. select * from a_grade;
```

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | A |
| 3 | jaanu | 21 | A |

Display values of new table

The provided SQL commands first create a new table named `a_grade` with columns for student ID, name, age, and grade. Then, it populates this table by copying records from the existing `school` table where the grade is 'A'. Finally, it retrieves and displays all records from the `a_grade` table to show the students who have grade 'A'.

f) what are the operations performed with `delete`?

↳ we can Delete single row in a table.

↳ we can Delete multiple rows in a table.

Note:- if you perform delete operation without where condition means your entire rows will be Deleted.

7) what is (Safe update) mode in MySQL?

Safe Update Mode in MySQL is a setting designed to prevent accidental updates or deletions of large amounts of data. When enabled, it requires a **WHERE** clause in **UPDATE** or **DELETE** statements that specifies a key column, which helps avoid unintentional changes to the entire table.

To turn on Safe Update Mode, use the following query:

sql Query to turn ON Safe update mode

```
SET SQL_SAFE_UPDATES = 1;
```

To turn off Safe Update Mode, use:

sql Query to turn off safe update mode

```
SET SQL_SAFE_UPDATES = 0;
```

Turning Safe Update Mode on or off affects only the current session. If you want to make this change permanent, you need to adjust the MySQL configuration file (`my.cnf` or `my.ini`) and restart the MySQL server, but this is generally not recommended unless you fully understand the implications.

note: when safe (update mode)

is turn off only you can perform (Delete or) update operation without (where condition).

8) lets see how to delete single row from a table?

```
71. select * from a_grade;
```

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | A |
| 3 | jaanu | 21 | A |
| 4 | lakshith | 10 | B |
| 5 | Darshith | 7 | B |

```
71. delete from a_grade where stu_id=4;
```

```
72. select * from a_grade;
```

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | A |
| 3 | jaanu | 21 | A |
| 5 | Darshith | 7 | B |

The SQL command `DELETE FROM a_grade WHERE stu_id = 4;` removes the ^{row} record from the `a_grade` table where the `stu_id` is `4`. This command will delete only the row with `stu_id` equal to `4` if it exists in the table. If no such row exists, the command will have no effect.

9) how to Delete multiple rows from a table?

72. `select * from a_grade;`

| Result Grid | Filter Rows: | Export: | Wrap Cell Content: |
|-------------|--------------|---------|--------------------|
| stu_id | stu_name | stu_age | grade |
| 1 | lavanya | 20 | A |
| 3 | jaanu | 21 | A |
| 5 | Darshith | 7 | B |

71. `delete from a_grade where stu_id in(3,5);`

72. `select * from a_grade;`

| Result Grid | Filter Rows: | Export: | Wrap Cell Content: |
|-------------|--------------|---------|--------------------|
| stu_id | stu_name | stu_age | grade |
| 1 | lavanya | 20 | A |

The SQL command `DELETE FROM a_grade WHERE stu_id IN (3, 5);` removes records from the `a_grade` table where the `stu_id` is either 3 or 5. This command will delete all rows that match these `stu_id` values. If no rows with these IDs exist, the command will have no effect.

10) update in mysql?

↳ we can update single value in a row

↳ we can update multiple values in a row

↳ we can update different values for different rows

using **Switch case** ⇒ Along with update

↳ we can create a temporary column using

update ⇒ Along with **switch case**

11) how to update single value in a row?

78. `select * from a_grade;`

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | A |
| 2 | jaanu | 21 | A |
| 3 | lakshit | 10 | B |
| 4 | darshith | 7 | B |

80. `update a_grade set stu_age = 11 where (stu_id = 3);`

81. `select * from a_grade;`

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | A |
| 2 | jaanu | 21 | A |
| 3 | lakshit | 11 | B |
| 4 | darshith | 7 | B |

The SQL command `UPDATE a_grade SET stu_age = 11 WHERE stu_id = 3 AND stu_age = 10;` updates the `stu_age` to `11` in the `a_grade` table only for the row where `stu_id` is `3` and the current `stu_age` is `10`. This ensures that the update only occurs if the age was previously `10`, thereby preventing unintended changes if the `stu_age` has already been modified.

12) How to update multiple values in a table?

```
81. select * from a_grade;
```

| Result Grid | Filter Rows: | Export: | Wrap Cell Contents: |
|-------------|--------------|---------|---------------------|
| stu_id | stu_name | stu_age | grade |
| 1 | lavanya | 21 | A |
| 2 | jaanu | 21 | A |
| 3 | lakshit | 11 | B |
| 4 | darshith | 7 | B |

```
80. update a_grade set stu_age = 20, grade='B' where (stu_id = 1);
```

```
81. select * from a_grade;
```

| Result Grid | Filter Rows: | Export: | Wrap Cell Contents: |
|-------------|--------------|---------|---------------------|
| stu_id | stu_name | stu_age | grade |
| 1 | lavanya | 20 | B |
| 2 | jaanu | 21 | A |
| 3 | lakshit | 11 | B |
| 4 | darshith | 7 | B |

The SQL command `UPDATE a_grade SET stu_age = 20, grade = 'B' WHERE stu_id = 1;` updates the `stu_age` to `20` and the `grade` to `'B'` for the record in the `a_grade` table where `stu_id` is `1`. This command will modify both the age and grade for the student with ID `1`. If no such record exists, the command will have no effect.

13) how to update different rows with different values for single column?

```
171 • select * from a_grade;
```

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | B |
| 2 | jaanu | 21 | A |
| 3 | lakshit | 11 | B |
| 4 | darshith | 7 | B |

This command updates the **grade** column in the **a_grade** table based on the **stu_id**:

- If **stu_id** is 1, the **grade** is set to 'C'.
- If **stu_id** is 3, the **grade** is set to 'D'.
- If **stu_id** is 4, the **grade** is set to 'E'.
- For all other **stu_id** values, the **grade** remains unchanged (**ELSE grade**).

In essence, this command conditionally updates the **grade** for specific student IDs while leaving grades for other students as they are.

```
163 • update a_grade
```

```
164 set
```

```
165     grade=case
```

```
166     when stu_id=1 then 'C'
```

```
167     when stu_id=3 then 'D'
```

```
168     when stu_id=4 then 'E'
```

```
169     else grade
```

```
170 end;
```

```
171 • select * from a_grade;
```

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | C |
| 2 | jaanu | 21 | A |
| 3 | lakshit | 11 | D |
| 4 | darshith | 7 | E |

14) How to update different rows with different values for multiple columns?

```
175 • select * from a_grade;
```

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 20 | C |
| 2 | jaanu | 21 | A |
| 3 | lakshit | 11 | D |
| 4 | darshith | 7 | E |

- For **grade** column:
 - If **stu_id** is 1, the **grade** is set to 'A'.
 - If **stu_id** is 4, the **grade** is set to 'C'.
 - For all other **stu_id** values, the **grade** remains unchanged.
- For **stu_age** column:
 - If **stu_id** is 1, the **stu_age** is set to 21.
 - If **stu_id** is 3, the **stu_age** is set to 10.
 - For all other **stu_id** values, the **stu_age** remains unchanged.

```
163 • update a_grade
```

```
164 set
```

```
165     grade=case
```

```
166     when stu_id=1 then 'A'
```

```
167     when stu_id=4 then 'C'
```

```
168     else grade
```

```
169     end,
```

```
170     stu_age=case
```

```
171     when stu_id=1 then 21
```

```
172     when stu_id=3 then 10
```

```
173     else stu_age
```

```
174 end;
```

```
175 • select * from a_grade;
```

| stu_id | stu_name | stu_age | grade |
|--------|----------|---------|-------|
| 1 | lavanya | 21 | A |
| 2 | jaanu | 21 | A |
| 3 | lakshit | 10 | D |
| 4 | darshith | 7 | C |
